Answers to questions following the 10th Loss Data Workshop

Jiri Musilek, IZSCR (Fire Rescue Service of the Czech Republic)

1. **How to establish, activate and steer a network of relevant stakeholders?**
   - Data Loss group is a group of experts and can be further used as a basic platform, but it would be fine to make the group more consistent. For example representation of national authorities as well as private sector from each country would help to create broader think-tank of information. Activation via e-mail is sufficient and steering via regular meetings twice a year seems also fine.

2. **How to use external expertise, best practices and lessons learnt?**
   - Best practices should be presented at the meeting and implemented by national authorities at voluntary basis.

3. **How to prepare feasible roadmaps and action plans for DDLD collection?**
   - Data Loss Group is already collecting national data and therefore we think that ongoing work should not be stopped, keep ongoing trend of data collection.

4. **What common needs may be identified that could result in new policies and/or tools to support national, regional and local authorities?**
   - At this moment all personnel is busy enough with collecting data for Sendai indicators and therefore we do not support any new policies due to lack of people and time. Also I have not seen any proposal for what reason are data collected. There is no need for more data, the need is in using them for enhanced prevention and response, which should be the primary task.
